

Abdullah Giray Yağlıkçı

Senior Researcher and Lecturer at SAFARI Research Group in
ETH Zurich

✉ giray.yaglikci@safari.ethz.ch

Up-to-date version of CV is available at <https://agyaglikci.github.io/agyaglikci.github>

I am a senior researcher and lecturer at the [Safari Research Group](#) in [ETH Zürich](#), working with [Prof. Onur Mutlu](#). My current broader research interests are in computer architecture, systems, and hardware security, focusing on robust and high-performance memory systems. In particular, my PhD research focuses on understanding and solving the RowHammer vulnerability. I have published several works on this topic in major venues such as HPCA, MICRO, ISCA, USENIX Security, DSN, and SIGMETRICS. Among these works, BlockHammer was named as a finalist by Intel in 2022 for the Intel Hardware Security Academic Award [🏆](#), Svärd received the first place in the ACM SRC at PACT 2023 [🏆](#). My dissertation was selected as one of the five finalists in the HOST 2024 PhD dissertation competition [🏆](#). My RowHammer research is in part supported by the Google Security and Privacy Research Award and the Microsoft Swiss Joint Research Center.

Enabling Efficient and Scalable DRAM Read Disturbance Mitigation via New Experimental Insights into Modern DRAM Chips in PhD Thesis, ETH Zürich, 2024

Full Reference: A. Giray Yağlıkçı, "Enabling Efficient and Scalable DRAM Read Disturbance Mitigation via New Experimental Insights into Modern DRAM Chips," ETH Zürich, 2024.

This PhD dissertation, based on my PhD research, demonstrates that we can mitigate DRAM read disturbance efficiently and scalably by 1) building a detailed understanding of DRAM read disturbance, 2) leveraging insights into modern DRAM chips and memory controllers, and 3) devising novel solutions that do not require proprietary knowledge of DRAM chip internals. This thesis comprehensively explains the cutting edge in DRAM read disturbance research as of August, 2024, and identifies future research avenues to address the outstanding and emerging challenges in the field.

Spatial Variation-Aware Read Disturbance Defenses in HPCA 2024

Full Reference: A. Giray Yağlıkçı, Yahya Can Tuğrul, Geraldo F. Oliveira, İsmail Emir Yüksel, Ataberk Olgun, Haocong Luo, Onur Mutlu "Spatial Variation-Aware Read Disturbance Defenses: Experimental Analysis of Real DRAM Chips and

Implications on Future Solutions" Proceedings of the 30th IEEE International Symposium on High-Performance Computer Architecture (HPCA-30), 2024.

We tackle the performance overhead of existing read disturbance solutions by leveraging the spatial variation in read disturbance across different memory locations in real DRAM chips. To do so, we 1) present the first rigorous real DRAM chip characterization study of spatial variation of read disturbance and 2) propose Svård, a new mechanism that dynamically adapts the aggressiveness of existing solutions based on the row-level read disturbance profile. Our experimental characterization on 144 real DDR4 DRAM chips representing 10 chip designs demonstrates a large variation in read disturbance vulnerability across different memory locations: in the part of memory with the worst read disturbance vulnerability, 1) up to 2x the number of bitflips can occur and 2) bitflips can occur at an order of magnitude fewer accesses, compared to the memory locations with the least vulnerability to read disturbance. Svård leverages this variation to reduce the overheads of five state-of-the-art read disturbance solutions, and thus significantly increases system performance.

HiRA: Hidden Row Activation for Reducing Refresh Latency of Off-the-Shelf DRAM Chips in MICRO 2022

Full Reference: A. Giray Yağlıkcı, Ataberk Olgun, Minesh Patel, Haocong Luo, Hasan Hassan, Lois Orosa, Oguz Ergin, and Onur Mutlu, "HiRA: Hidden Row Activation for Reducing Refresh Latency of Off-the-Shelf DRAM Chips" Proceedings of the 55th International Symposium on Microarchitecture (MICRO), Chicago, IL, USA, October 2022.

We propose a new operation, Hidden Row Activation (HiRA), and the HiRA Memory Controller (HiRA-MC) to perform HiRA operations. HiRA hides a refresh operation's latency by refreshing a row concurrently with accessing or refreshing another row within the same bank. Unlike prior works, HiRA achieves this parallelism without any modifications to off-the-shelf DRAM chips. To do so, it leverages the new observation that two rows in the same bank can be activated without data loss if the rows are connected to different charge restoration circuitry. HiRA reduces the time spent on refresh operations by 51.4%. HiRA-MC increases system performance by 12.6% and 3.73x as it reduces the performance degradation due to periodic refreshes and refreshes for RowHammer protection (preventive refreshes), respectively, for future DRAM chips with increased density and RowHammer vulnerability.

Understanding RowHammer Under Reduced Wordline Voltage in DSN 2022

Full Reference: A. Giray Yağlıkcı, Haocong Luo, Geraldo F. de Oliveira, Ataberk Olgun, Minesh Patel, Jisung Park, Hasan Hassan, Jeremie S. Kim, Lois Orosa, and Onur Mutlu, "**Understanding RowHammer Under Reduced Wordline Voltage: An Experimental Study Using Real DRAM Devices**" Proceedings of the 52nd Annual IEEE/IFIP International Conference on Dependable Systems and Networks (DSN), Baltimore, MD, USA, June 2022.

This is the first work to experimentally demonstrate on 272 real DRAM chips that lowering VPP reduces a DRAM chip's RowHammer vulnerability. We show that lowering VPP 1) increases the number of activate-precharge cycles needed to induce a RowHammer bit flip by up to 85.8 % with an average of 7.4 % across all tested chips and 2) decreases the RowHammer bit error rate by up to 66.9 % with an average of 15.2 % across all tested chips. At the same time, reducing VPP marginally worsens a DRAM cell's access latency, charge restoration, and data retention time within the guardbands of system-level nominal timing parameters for 208 out of 272 tested chips. We conclude that reducing VPP is a promising strategy for reducing a DRAM chip's RowHammer vulnerability without requiring modifications to DRAM chips.

A Deeper Look into RowHammer in MICRO 2021

Full Reference: Lois Orosa, Abdullah Giray Yağlıkcı, Haocong Luo, Ataberk Olgun, Jisung Park, Hasan Hassan, Minesh Patel, Jeremie S. Kim, and Onur Mutlu, "**A Deeper Look into RowHammer's Sensitivities: Experimental Analysis of Real DRAM Chips and Implications on Future Attacks and Defenses**" Proceedings of the 54th International Symposium on Microarchitecture (MICRO), Virtual, October 2021.

We present an experimental characterization using 248 DDR4 and 24 DDR3 modern DRAM chips from four major DRAM manufacturers demonstrating how the RowHammer effects vary with three fundamental properties: 1) DRAM chip temperature, 2) aggressor row active time, and 3) victim DRAM cell's physical location. Among our 16 new observations, we highlight that a RowHammer bit flip 1) is very likely to occur in a bounded range, specific to each DRAM cell (e.g., 5.4% of the vulnerable DRAM cells exhibit errors in the range 70 °C to 90 °C), 2) is more likely to occur if the aggressor row is active for longer time (e.g., RowHammer vulnerability increases by 36% if we keep a DRAM row active for 15 column accesses), and 3) is more likely to occur in certain physical regions of the DRAM module under attack (e.g., 5% of the rows are 2x more vulnerable than the remaining 95% of the rows). Our study has important practical implications on future RowHammer attacks and defenses. We describe and analyze the implications of our new findings by proposing three future RowHammer attack and six future RowHammer defense improvements.

BlockHammer: Preventing RowHammer at Low Cost by Blacklisting Rapidly-Accessed DRAM Rows in HPCA 2021

Full Reference: A. Giray Yağlıkcı, Minesh Patel, Jeremie S. Kim, Roknoddin Azizi, Ataberk Olgun, Lois Orosa, Hasan Hassan, Jisung Park, Konstantinos Kanellopoulos, Taha Shahroodi, Saugata Ghose, and Onur Mutlu, "**BlockHammer: Preventing RowHammer at Low Cost by Blacklisting Rapidly-Accessed DRAM Rows**," in Proceedings of the 27th International Symposium on High-Performance Computer Architecture (HPCA), Virtual, February-March 2021.

In this paper, we show that it is possible to efficiently and scalably prevent RowHammer bitflips without knowledge of or modification to DRAM internals. We introduce BlockHammer, a low-cost, effective, and easy-to-adopt RowHammer mitigation mechanism that prevents all RowHammer bitflips while overcoming the two key challenges: scalability with worsening RowHammer vulnerability and compatibility with commodity DRAM chips. BlockHammer selectively throttles memory accesses that may cause RowHammer bitflips. To our knowledge, this is the first work that prevents RowHammer bitflips efficiently and scalably without knowledge of or modifications to DRAM internals.
